Plant Application Guide

Plant Specifications

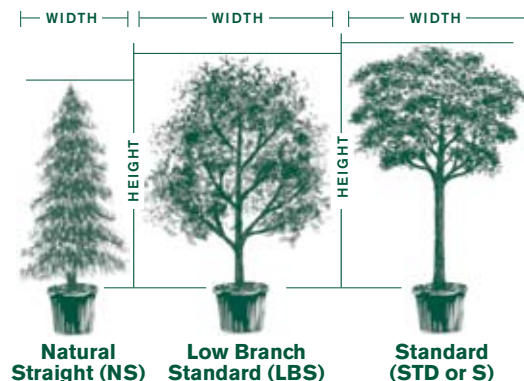

For specimen box trees and large quantities of shrubs we provide plant specifications upon your request. The American Standard for Nursery Stock is our general guide for specifications, but we do include measurements specific to containerized material grown in California. We measure specifications as shown below:

TREES

Standard (STD), Low Branch Standard (LBS), Natural Straight (NS)

The specifications include:

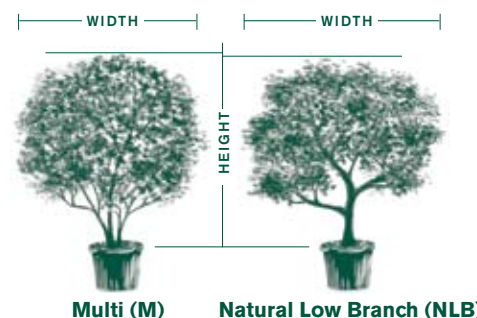

- Height from the soil inside the container to the top of the tree
- Width of the foliage or branches
- Caliper of 4" or less measured at 6" from the soil and caliper of larger than 4" is measured 12" from the soil

Multi (M), Natural Low Branched (NLB)

The specifications include:

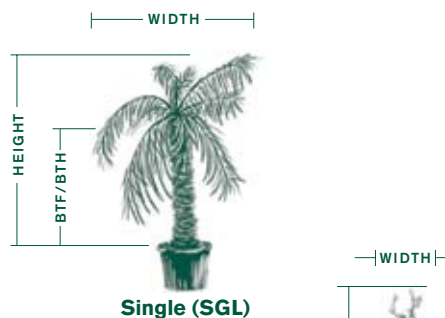

- Height from the soil inside the container to the top of the tree
- Width of the foliage or branches
- Caliper is usually not included due to the low branching or multi growth habit

Palms

The specifications include:

- Height from the soil inside the container to the top of the tree
- Width of the foliage
- Trunk Height (BTF or BTH) measured from the soil level to the base of the heart leaf

SHRUBS & VINES

The specifications include:

- Height from the soil inside the container to the top of the plant
- Width of the foliage

ESPALIERS

The specifications include:

- Coverage percentage. How much of the trellis is covered
- Fullness percentage. How thick is the plant material on the trellis
- 5 Gallon Trellis measures 3' tall x 3' wide
- 15 Gallon Trellis measures 5' tall x 4' wide

Rooting approximation from field inspection is included to inform you of the condition of the roots inside the container and any other descriptive comments as necessary to accurately describe the plant.
